## The harsh economics of tyranny

Freedom ends when we can no longer afford to resist

Page 3

# Farmageddon plot

by ICE AGE FARMER

**THE media is feeding a 'food shortage' frenzy by blaming climate change and hostile nations for a looming starvation scenario.**

These were exactly the same causes put forward in many tabletop exercises, including 2015's Food Chain Reaction: A Global Food Security Game which, unsurprisingly, demanded 'better global governance'.

But the genesis of this food crisis – being used to justify an acceleration of gene-edited crops and other measures advancing the technocratic takeover of food – lies not in Russian aggression or carbon dioxide, but in bad government policies and corporate economic warfare against farmers for generations.

Though several books could be dedicated to the systematic strangulation of British farming, here are a few of the more egregious attacks on agriculture.

While the UK's general inheritance tax (IHT) sits at 40 per cent, farms historically have been shielded from this by an Agricultural Property Relief policy. Family farms were handed down from one generation to the next, as has been done by humans since the dawn of time. That ended on April 6.

Tax relief for agricultural property was capped this year at £2.5m – which doesn't go far considering the value of farmland and required equipment. Everything thereafter is subject to an effective IHT of 20 per cent on farms that are already running on very thin margins. This is why so many cash-poor, asset-rich farms are

Engineering a food shortage through staggeringly bad policies. Photo: John Cameron

getting sold, so that inheritors can pay huge inheritance tax bills.

This is staggeringly bad policy, effectively forcing experienced farmers off their land. The UK has also cut off financial support to farms. Britain once paid farmers to grow food. The EU turned that into a land cheque called the Basic Payment Scheme (BPS). After Brexit, this subsidy to producers (now called 'delinked payments') was set to expire gradually over time, shifting instead to a Sustainable Farming Incentive (SFI).

While the BPS began at £180 to £230 per hectare, resulting in an average payment of £28,400 per year, the delinked payments are this year capped at just £600, with the SFI shut down in 2025 when its budget was

exhausted. Thousands of producers were left out to dry.

These payments to farmers to ensure food security, which began post-World War Two and upon which farmers became dependent, have been unceremoniously axed. This, alone, has been a disaster for British producers, pushing many into a cash flow crisis.

Once farms were unprofitable, the UK went further, actively incentivising some producers to stop farming their land and shed their livestock through a new 'land use' plan.

The January 2025 blueprint set specific goals: more than ten per cent of England's

farmland should stop producing food by 2050. Farms were incentivised to transition to hosting agritourism activities like glamping or, worse yet, solar installations.

The Knepp Castle Estate is one such example. Its homepage tells the story quite clearly. Where once winter wheat, barley, oats and maize were grown, and where 600 dairy cows and sheep were raised, now one finds yurts available for rental.

Now, with yields at historic lows, we see headlines blaming Russia and climate change.

And yet, somehow, this entirely relevant backstory is lost, eclipsed by the administration's rush to adopt gene-edited food and drone-surveilled precision agriculture.

They did not need to ban traditional farming. They simply made the farm economically unviable, paid producers to do anything other than produce, and are now calling the missing food a climate emergency.

This food crisis was engineered through bad policy, and is now being marketed as bad weather.

And that is all the more reason we should be growing more food and redoubling efforts at creating lasting food security for our families and communities.

# Mass medication by back door

## Our daily bread: Soon unfit for human consumption

by **SERENA WYLDE**

**FROM** December, all non-wholemeal wheat flour will be required by law to have synthetic folic acid added to it.

In reality, however, mills have been adding it since the Autumn of 2024 when it was recommended, but some packaged bread and other products may have failed to reflect it on the label as they used up stocks of old packaging.

Folic acid is not a food ingredient, it is a licensed drug synthesised in a laboratory. It is never found naturally in food, and is treated as a drug by the regulator and health service.

The policy to mandate its addition to all non-wholemeal wheat flour, including organic and imported, was passed by statutory instrument, with no debate and no vote in the House of Commons.

Its ostensible justification is that government modelling suggests fortification might reduce the number

Far-reaching flour law fails acid test on health. Photo: pd

of pregnancies affected by a neural tube defect by about 200 per year. But there is evidence that, for every claimed prevented birth defect, there are nine pregnancy losses. And the evidence of health risks to the population at large is multi-layered.

The obvious question is, even if there were sound evidence that it prevented birth defects in a subset of people, why medicate an entire population? As Dr. Clare Craig writes: ‘It is unethical to justify harming one person by claiming a theoretical benefit for someone else’.

Mass medication of any section of the

population without informed consent and opt-outs crosses an ethical line. But in this case, it is our entire population and, by any reasonable assessment, it is a crime to doctor the nation’s most heavily relied-upon staple food.

On June 26, the Health Advisory and Recovery Team (HART) and UK Medical Freedom Alliance teamed up to write to the Secretary of State for Health and Social Care, copied to the Under-Secretary of State for Public Health. In it they wrote:

‘In 1875, Parliament made it a criminal offence to adulterate flour. The Sale of Food and Drugs Act of that year addressed a scandal that had been building for decades in which bakers bulked out their bread with alum, chalk and Plaster of Paris.

‘The principle laid down by the Act was clear and has never been repealed – you must not tamper with the staple food of the nation nor put anything into bread that is injurious to health.

‘151 years later, your department is about to do exactly that. From 13th December 2026, under the Bread and Flour (Amendment) Regulations 2024, every sack of non-wholemeal white flour sold in this country must contain synthetic folic acid. Imported flour is included. Organic flour is included. There is no opt-out for anyone who would prefer not to ingest folic acid.’

The letter was signed by Drs. Clare Craig BM BCH, FRCPath; Ros Jones MBBS, MD, FRCPC; and Elizabeth Evans MA, MBBS, DRCOG, and set out the health risks to the population.

The letter elicited a copy-and-paste response from an unnamed ‘correspondence officer’ of the Public Enquiries Department of Health and Social Care, sent from a ‘do not reply’ e-mail.

Dr. Clare Craig has published an in-depth, comprehensive series of articles, available on the HART website, showing why the proposed mandate is unscientific and harmful, and must be abandoned.

Dr. Craig points to the NHS’s own website page ‘Who can and cannot take folic acid’, which includes those with an allergy, low Vitamin B12, pernicious anaemia, cancer, kidney dialysis, or a heart stent. She also informs us that studies suggest that men face a doubling of prostate cancer risk from folic acid exposure.

In an article entitled ‘The Impossible Shop’, she trawls through an array of ‘wholemeal’ breads, all of which contain folic acid because they also contain non-wholemeal white flour, exposing the lie that the consumer has choice and can avoid it. This includes wholemeal Pitta bread. And also applies to many loaves made from rye flour because it is mixed with non-wholemeal white flour.

Aside from bread, folic acid will be in breakfast cereals, pasta, noodles, pizza, pies, biscuits, cakes, tarts, batter, sauces, and so on.

No trial has ever been designed to measure the adverse effects of folic acid, but animal models provide evidence of harm. See Dr. Craig’s article ‘Three things high folic acid does to animals’. In it, she explains that the human enzyme which converts folic acid works about 1,300 times more slowly than the equivalent enzyme in rats, yet nonetheless, three clear types of harm are seen in rodents: altered brain development, weakened immune defence, and faster growth of tumours that already exist. There is 25 years of evidence on these topics.

She also informs us that pooled clinical trials show an increase of between 18 and 23 per cent in new cancer diagnoses among those taking folic acid at doses under 1mg per day, and that is the dosing range which fortification will create.

In conclusion, is this irrational and reckless move to medicate an entire population, without its knowledge or consent, a function of hubristic ineptitude, or a deliberate intent to harm?

Whichever it is, it’s time to form baking networks between ourselves using real wholemeal flour, rye, spelt and any other uncontaminated flour. If we can reduce the purchase of products containing folic acid (approximately 70 per cent of all packaged food) by even ten per cent, the flour makers, the packaged food manufacturers and the supermarkets will soon feel it.

“The contemporary agenda of energy, food and inflation exceeds the capacity of any single government to resolve.”

*Henry Kissinger, 1974*

# The economics of tyranny

## Freedom ends when we can no longer afford to resist

by **THE DO NOT COMPLY GUY**

**IF we can still sit online and say what we think – criticise the system, call out corruption, question powerful people, and scream into the digital town square without someone knocking on the door later – it is not because the people obsessed with control suddenly are struggling with their agenda or discovered any shred of respect for freedom.**

It's because they are buying time; they are building.

You do not turn the screws all the way down while the population can still collectively tell you to go screw yourself. You do not immediately make fuel £10 per litre while millions of people can still organise, communicate, move money, expose what you are doing, gather in huge numbers and make governing miserable. You do not turn the calamity dial to maximum before you have built the machinery capable of managing the reaction. That would be stupid.

A genuine police-state level of control would not begin with terminator robots. It would begin with infrastructure: databases, surveillance, digital identification, artificial intelligence monitoring, financial tracking, cameras, algorithms, speech moderation, behaviour profiling, emergency authorities, more centralised systems, more dependence, more rules and more little switches that can be flipped later.

Meanwhile, you bring 'free speech' back and let people talk. You let them complain. You let them rant. You let them create videos. You study them. Why shut everyone up when they will voluntarily tell you what they know, what they believe, who they associate with, what makes them angry, what they fear, where they go, what they buy, which movements they support and which institutions they distrust?

What do we see? Dissent being turned into actionable data.

Censorship is not the first objective; identification is. You do not proceed without the map that people are still drawing for you. You figure out who complains, who organises, who influences other people, who won't fall in line, who questions narratives immediately, who has reach, who can move crowds, who can expose the nonsense and who refuses to shut up. Then you continue to build systems capable of containing those people later.

Can you afford to say no? Photo: Nicola Barts

**Someone living paycheck to paycheck is easier to intimidate than someone with years' worth of savings and preparation. The unprepared cannot afford revolt. They can barely afford Tuesday**

That possibility is more disturbing than a cartoon tyrant screaming about martial law. The modern version would not necessarily arrive screaming. It would arrive with a user agreement, an app update, a banking policy, a national emergency, a verification requirement, a safety initiative, a temporary restriction, a new identification system, a new database and new categories of prohibited activity.

To the untrained eye, they look like a thousand microscopic pieces, each somewhat harmless on its own. Then one day, enough switches flip, so that everybody suddenly realises that those seemingly harmless systems had been connecting the entire time.

Economics would be one of the key weapons. If you ask why things are not worse already – the question answers

itself. You cannot economically suffocate billions of angry people while you still lack the ability to control the reaction. You boil the frog. You raise the pressure gradually.

You normalise instability, debt, barely surviving, groceries eating half your pay, rent or mortgage swallowing the rest and people having no financial cushion. Someone living paycheck to paycheck is easier to intimidate than someone with years' worth of savings and preparation. The unprepared cannot afford revolt. They can barely afford Tuesday.

Combine financial desperation with technological control, and dissent has consequences without most ever calling it punishment. Employment becomes uncertain. Banking gets complicated. Accounts disappear. Insurance changes. Access gets restricted. Identity requires

verification everywhere. Movements become increasingly visible. Choices become more and more authorised.

Nobody technically arrested you. They simply made existence inconvenient enough that compliance became the cheaper and safer option.

That is the version that should scare people – not a dramatic Hollywood coup, but a quiet system in which control becomes so integrated into ordinary life that nobody can identify the exact moment freedom disappeared. They only remember the day they realised that it was gone.

I am not saying any of this must be a foregone conclusion. We must not predictively programme or just lay down and accept this as our fate. We can stop this trajectory. I want all of this to be wrong – and if so, thank God. Ten years from now people can laugh, and say it was just overthinking or paranoid delusion. That would be a welcome outcome for me.

The alternative truth is darker – that this relatively quiet period was not evidence that powerful institutions struggled with their appetite for control. It was construction season – and a project going to plan. The silence during this time was not any form of struggle or surrender. It was merely preparation. The censorship experiments were not the finished product. They were beta testing.

Let us not get distracted or complacent – what we are witnessing is not about controlling everybody today. It is about building the ability to control everybody tomorrow. Take your data privacy seriously. Be mindful of what you feed the beast. Know that the economic pain we are seeing right now is not at the maximum setting. We have not even remotely seen the maximum yet.

Maximum pressure waits until our refusal has been made impractical.

They will not finish tightening until the exit and the refusal have been priced out of reach. The noose is not made out of actual rope. It is login, ledger, location and ID, already fitted, already tightening, and already so ordinary that most people won't bother to notice – most will continue to convince themselves that all of this is no big deal.

Be on the right side of history. Get ready to say no.

# 9/11 and the war on humanity

by SHANE FUDGE

**THE 25th anniversary of the events of September 2001 was an ominous signpost to those who understand our current world and the arc of change since 2020.**

Just like covid, the unravelling of the official narrative around this event has become clearer, more informed and more credible as the years have unfolded, revealing the deeper implications for us all.

In his book *The New Pearl Harbour Revisited*, David Ray Griffin observes that, in the quarter century since September 11, 2001 'there has been a dramatic decrease in the number of people who are confident about the truth in the official account of events.'

Perhaps the biggest debate in recent years is not about questioning the official narrative, but to explain how the destruction of the World Trade Centre occurred and who was really involved.

An event in New York this September, *Turning the Tide: 9/11 Twenty-Five Years Later*, brought together those still seeking justice for four days of networking, discussions, presentations and proposed actions.

One of the keynote speakers, Pink Floyd's Roger Waters, has more recently been a part of the justice movement, helping to fund one of the three petitions (family members calling for review of evidence) which was due to be examined by the Supreme Court on October 15.

While the nearly 3,000 people who died were commemorated, themes discussed at the conference reflect the broader issues we now face in a post 9/11 world. These included:

- the ongoing erosion of civil liberties, privacy and human rights;
- endless wars and parallel rejuvenation of the military industrial complex in the aftermath of the events of September 11th, 2001;
- the ongoing funnelling of wealth and power into fewer and more nefarious hands;
- The links to other related events and psyops i.e. the scamdemic and climate change.

Indeed, the dismantling of the official 9/11 narrative has become a useful metaphor for understanding the multitude of ways in which we have been lied to, gaslighted and victimised by our own governments – and how this has been accelerated over the last two decades.

Onlookers watch the demolition of three World Trade Centre towers in disbelief. Photo: pd

And all while they have pursued self-interest, greed and power under the shield of 'democracy'.

The Patriot Act 2001, which was mobilised under the guise of national security, paved the way for the U.S. government – and by extension, the security state as a model of western governance – to increase surveillance of citizens, to enhance state investigative powers to deter and punish, and to widen interpretations of terrorism and national security.

The Patriot Act was a key milestone for increased authority to wiretap, to accelerate and better enable information sharing, and to begin the process of opening-up greater third-party access to citizen data, records, and personal information.

Palantir, the organisation which has led the way in providing the technological framework for World Economic Forum founder Klaus Schwab's solution to planetary crisis – the great reset – would almost certainly not have survived without the events of September 11, 2001, to frame its operations.

At the time of 9/11, Palantir was a small Silicon Valley start-up company which had suffered mixed fortunes in scaling up its business model and technical expertise beyond PayPal.

Successfully aligning itself with the burgeoning security state and extensive military funding means that, today, Palantir will be the central catalyst in synthesising vast amounts of data into a one-stop shop of government surveillance and control.

In co-founder Alex Karp's technological republic, 'governments, military bodies, health agencies, large corporations and businesses, will now be able to mine, integrate, and synthesise vast amounts of data on the population' – creating the predictive algorithm systems necessary for a virtual police state.

This will be complemented by a cashless society, where all transactions will be digital and subject to state monitoring, accreditation and authorisation. In other words, choose non-compliance and you will be locked out of society.

Viewed through the lens of a deep state operation sanctioned by the U.S. government, it is difficult to avoid the most glaring question which is raised by this interpretation of the events of September 11, 2001, namely 'why would a western government become aggressors against its own people'?

If you have been following the money, you will likely reach the same conclusion about the events which unfolded from 2020. Debt had become unmanageable. Consumption (and consumers) a drain on resources.

Jobs were now scarcer and welfare levels had reached unsustainable levels. It had become time for a new system – one in which people had now become expendable.

The perfect storm of technological innovation, political opportunism and the concentration of power and wealth, meant there was now an opportunity to replace the majority of the population with artificial intelligence, artificial labour and a completely technological economy.

The ideas were repackaged as 'sustainable development' – where the unregulated wants and needs of human populations were now a problem to be solved by technocrats and their billionaire paymasters.

The events of 9/11 do not stand outside a comprehension of what is currently happening in our world. On the contrary, this date signalled the beginning of a period in our history where it was clear that western governments were now prepared to strike directly at their own citizens.

While a generation of people since 1945 have been exposed to war primarily through their TV screens, many would now come to experience such conflict on their own back doorstep, with the deployment of weaponised vaccines, food and water; geo-engineering and environmental interference; culture, race, and gender wars; and endless propaganda and misinformation campaigns designed to control, coerce, and to dismantle the human spirit.

This signalled a beginning of a change in the 'managed global conflict' i.e. endless wars in the name of a few, outlined brilliantly by author and economist Antony C. Sutton.

This agenda would now be supplanted and revised to align with a post-2001 political landscape, and the possibilities of 'fifth generation warfare'.

While human enslavement and elite control of the masses have always been the modus operandi, September the 11 is arguably the key event whereby the ruling elite openly showed its hand and displayed its real intentions.

# Doctor euthanised against his will

by JACQUI DEEVOY

## Retired surgeon was deprived of oxygen in ‘cruel’ hospital death

**NO-ONE** worked harder for his patients than Dr. Trincomalee Rajeswaran Vijayakumar.

The retired A&E trauma surgeon, Kumar to his friends, spent a career working in emergency care, long before ‘palliative care’ was commonplace. He was always there for others. However, when he needed emergency care himself, aged 89, no one came.

Kumar walked into hospital unaccompanied on July 11, 2023, suffering from shortness of breath. After a 13-hour wait, he was given a bed and, some days later, moved to a side room on a respiratory ward and put on high-flow oxygen via nasal cannula. Suspected of having pneumonitis (inflammation of the lung tissue), he stabilised. He said he felt well in himself, although he could not breathe without oxygen support.

Two weeks later, everything changed. The respiratory consultant told him it would take at least six weeks to see real improvement, given his age.

That same day, she reduced his oxygen. He told her he was reluctant as oxygen was vital for tissue regeneration. However, his wishes counted for little. It was, his daughter Jan now believes, the beginning of the end.

Starved of oxygen, he was pushed onto the respiratory-depressant Oramorph – a drug he made clear he did not want.

“The cruelty of the oxygen deprivation he endured over the succeeding eight days never leaves me,” says Jan. Nurses refused his repeated requests to increase his oxygen levels even as he struggled to breathe.

Her father described two of the nurses attending him as “a lethal combination”.

In his hospital diary he wrote that they repeatedly entered his room at night, turning his oxygen down, causing him to wake up, gasping for breath. He had written in his diary: ‘What conspiracy is this?’

When the family realised the extent of the oxygen deprivation, they sent four letters to the chief executive of the hospital trust. But no help came. Instead, Kumar began to be pressured onto an end-of-life pathway.

Dr. Trincomalee Rajeswaran Vijayakumar suffered a ‘cruel and unnecessary’ death

A new consultant arrived and, within 20 minutes, referred him to palliative care without taking any time to get to know his patient. Kumar said he wasn’t dying and refused palliative care. However, Jan said the medics would not take ‘no’ for an answer.

A friend of his – a retired surgeon – later visited Jan. She was at her father’s house, surrounded by his belongings. “Why on earth were they discussing palliative care with Kumar?” he said. “He wasn’t a terminally ill patient – he didn’t even have a diagnosis.”

On the morning of August 2, the new consultant told Kumar he would not be going home, would not survive the admission, and needed to accept palliative care because the treatment wasn’t working.

At a family meeting, the consultant sought permission to sedate him until he died.

“I couldn’t believe what I was hearing,” Jan recalls. “The consultant had a very strange expression on his face – I’d describe it as ‘faux concern’.

“I was struck by their lack of sincerity. They knew that my father was suffering due to lack of oxygen but they were

talking about focusing on his comfort and giving him dignity. Also, if he were considered palliative, why had they been reducing his oxygen so aggressively? None of it made any sense.”

The family requested a second opinion. That afternoon, another respiratory consultant from the same hospital examined him. He was upbeat, agreeing Kumar should have more time and as much oxygen as needed.

Unbeknown to her, however, her father’s medication had already been stopped and active care withdrawn.

“He wasn’t seen as a person but as an obstacle to be eliminated from the ward,” Jan states. “It didn’t matter that essential scans had never been performed or that his condition might be reversible.”

Jan now knows they had also removed his medication: long-term high blood pressure drugs, anticoagulants and high-dose steroids.

After a week of oxygen and sleep deprivation, this, in her opinion, virtually guaranteed he would not survive.

Despite his full mental capacity, the medication was withdrawn without his or Jan’s consent, and without legal process or consultation.

In the early hours of August 3, her mobile rang – her father’s number. A nurse said he had been trying to call and that she had better come in.

She found her father in a dark room with an on-call registrar and a nurse whom she had never seen before. The ward was silent. He was breathless, with chest pain and backache.

As morphine had not relieved his pain, midazolam was offered to “take the edge off”. Jan did not want it administered, but the pain was becoming so bad that her father could not lie on his back.

She now believes a hypertensive emergency was triggered by the abrupt medication withdrawal, and that he should have had a chest X-ray, echocardiogram and ECG. Neither the nurse who injected the midazolam nor the registrar kept proper records – both deny he ever had chest pain. After a large syringe of midazolam was injected into his abdomen, Jan’s father started mumbling incoherently, then he lost consciousness.

The registrar said the effects of the midazolam would wear off in about two hours. Though presented as a painkiller, midazolam has no painkilling properties and can heighten pain.

She said: “I now know that he would likely have been suspended in overwhelming pain for five-and-a-half hours, unable to communicate.”

Later that morning, Jan waited for her father to wake but he never regained consciousness.

She said: “Although his fingers had turned blue, until the moment his heart stopped beating, part of me still held onto hope. I will never forget the emptiness and disbelief I felt the moment he slipped away.”

After a lengthy battle with the hospital, Jan finally issued proceedings to obtain her father’s blood test results. Two suggested acute heart failure, others pointed to kidney issues and possible acute kidney injury.

Kumar had specifically requested an NT-proBNP test for heart failure but his results were never shared with him.

Jan said: “I couldn’t believe what I was reading. The withholding of these results from us meant we had been unable to make informed decisions about his care. Why did they hide my father’s blood test results from us?”

More than three years after her father’s death, Jan’s quest for answers continues.

# Let's talk about this anarchy thing

## When rulers are corrupt we must stop obeying their rules

by **PAUL CUDENEC**

**THIS** anarchy thing probably does not make any sense if you imagine that we really live in a democracy.

This anarchy thing no doubt seems destructive if you think that society is basically sound and has been constructed in the interests of the public as a whole.

This anarchy thing must be frightening if what makes you afraid is the disappearance of the slave system, rather than its continuation, consolidation and concentration.

The anarchist viewpoint may seem to you to be fanciful or extreme, but, in fact, it is based on reality and common sense.

The truth is that our natural freedom has been stolen from us and we are being ruled and exploited by a tiny group of criminals who cloak their domination in terms of law, order, civilisation, progress, science and modernity.

This anarchy thing will perhaps seem immoral if you have swallowed the lie that authority equals morality, that lawful is the same as just, and that your idea of what is right and wrong can be dictated to you by an exploitative cartel.

This anarchy thing must seem odd if you think that everything good in life comes from the state, that we could never live without it, that without a police force to watch over us we would all be at each other's throats, that without a

Technocratic dystopia or a natural existence: You decide

pharmaceutical industry we would all die of disease, and that without a top-down educational system we would all be stupid.

This anarchy thing must seem ridiculous if you think that human nature is based on the craving to compete, dominate and enslave.

Has it ever struck you that such traits are mainly displayed by the tiny clique that rules over the rest of mankind? Anarchism

knows this, has always said this, and is subsequently little heard in this clique-owned world.

This anarchy thing must appear outlandish if you picture its proponents as the system wants you to picture them; if you project onto them the officially approved profile of violence and incoherence.

A dozen years ago, my late parents came to support me when I was on trial, with

several others, for trying (and succeeding, so far) to halt the destruction of what is left of the English countryside by the fracking industry.

As well as learning that the police lie (absurdly claiming that their own video footage of the incident did not reflect the reality that they were trying to push), my parents met some of my anarchist friends and were astonished to find that they were not demons (they should have already known – their son and their former daughter-in-law were anarchists, after all). The indoctrination runs deep.

This anarchy thing is presented to you as a descent, a collapse, a disaster, whereas in fact it is a potential restoration, rebuilding and rebirth.

This anarchy thing is the reclaiming of our right to live our own lives, to write our own rules, to take the law into our own hands, to be what we want to be and what we were meant to be, to flourish naturally in the world without interference from fraudulent self-appointed authorities who would bleed us dry for their own profit.

This anarchy thing is about demanding the fulfilling existence of belonging, creating, loving, respecting and becoming that all real human beings long for with all their hearts.

This anarchy thing is about your freedom to be yourself.

# World's energy needs expected to soar

## Analysts predict huge rise as developing nations power up

by TYLER DURDEN

**EMERGING** economies are expected to see an explosion of energy demand over the coming decades, according to energy news site OilPrice.com.

Countries like Brazil, India, Nigeria and Indonesia are racing to expand their energy production and imports in order to keep up with rapid economic development.

While the leaders of these and other emerging economies are making a concerted effort to expand their renewable energy capacity, meeting demand will require an 'all-of-the-above' approach to energy that will extend the life of oil and gas, according to a new report from analysts S&P Global.

According to the recent study, emerging economies could increase the world's total energy demand by more than 60 per cent by 2060. 'That's comparable to adding another China to world consumption,' another recent report illustrates.

Speaking of China, the global superpower has become, by a gaping margin, the world's biggest manufacturer of the green energy infrastructure that is expected to power a lot of that growth.

Many of the world's developing countries have seen their solar power installations skyrocket in recent months thanks to a flood of cheap energy tech coming out of China, paired with volatility in oil and gas markets driven by the closure of the Strait of Hormuz.

Against this backdrop, emerging economies have become the new face of the renewable devolution. Over the last several years, countries including Brazil, Chile, El Salvador, Morocco, Kenya, and Namibia have overtaken the U.S. in their green energy transitions.

As of the close of 2025, 63 per cent of emerging markets in Africa, Asia and Latin America sourced more of their power generation from solar power than the United States.

But while a renewable expansion is picking up speed in the global south, S&P Global says not to expect a green energy takeover.

"This demand growth is going to be met with a multiplicity of different energies," said Dan Yergin, vice chairman of S&P Global. "Renewables will be an important part of it. You're going to see perhaps

The West Bolista oil rig docked at harbour in Tenerife. Photo: Maria Lupan

## Oil and gas will continue to be part of the demand picture for longer than many people think

more coal now...and oil and gas will continue to be part of the demand picture for longer than many people think."

While this reality is going to make worthless climate goals incredibly hard to achieve, emerging economies have pushed back against the expectation that they leapfrog over traditional fuel development and straight into a 100 per cent renewable grid.

Rich nations have promised to right this 'injustice' by funding decarbonisation in poorer countries, but the history of climate finance is riddled with broken promises.

While Chinese manufacturing has made renewables much cheaper and more attainable, that still requires massive investments on the part of countries that don't already have a well-established

energy sector.

'Emerging economies can't wait on renewables getting cheaper to grow their energy systems,' research site Marketplace writes, based on an interview with deputy executive director at the thinktank Energy for Growth Hub, Katie Auth.

Furthermore, despite the claimed growing threat of climate change, energy demand growth is a net positive for developing nations, Auth says.

"It's being driven by economic development, rising incomes, job creation," she said. "Right now, the average Liberian consumes less electricity in a year than my refrigerator does. So the scale of energy poverty is far worse than I imagine most Americans would ever think about," Auth told Marketplace.

This argument is only made more powerful by the recent explosion in energy demand in the developed world driven by internet usage and artificial intelligence.

# Looming language landslide

by **MARCUS BLACKETT**

**FOR** years, cultural commentators have insisted that people are getting more stupid.

Social media is saturated with half-formed thoughts, political debate has collapsed into slogans, and even bestselling books seem pitched at a middle-school reading level. The intuition feels right. Yet the evidence points elsewhere.

Our raw cognitive hardware – the biological machinery measured by IQ tests – has not declined. What has degraded is the linguistic environment that once trained ordinary minds to think in layers, hold tension, and reason with depth.

The shift is measurable across centuries. From the Enlightenment to the Industrial Revolution, English prose was syntactically demanding. Sentences routinely stretched 40 to 70 words, nested with subordinate clauses, hypotheticals, and qualifications that forced readers to track multiple ideas simultaneously.

Today, mass-market discourse has halved that demand – prose averages 14 to 20 words per sentence. The result is not stupidity but simplification.

Citizens can recognise bullet points but struggle to inhabit the layered architecture of thought that is required for our personal autonomy.

This collapse in linguistic density is not merely cultural – it is neurological. Humans translate experience into language automatically. Because inner speech is the medium through which we model reality, the density of that language determines the complexity of the models we build of ourselves, others, and the world.

Inner speech is the first filter for planning, inhibition, and task-switching. When inner speech becomes thin, so does self-regulation. A mind whose inner speech has been shaped by thin, declarative prose will default to thinner self-regulation. Dense language strengthens our ability to interrupt impulses, test hypotheses, and maintain continuity of self.

When we read or write sentences with multiple embedded clauses, the brain’s language circuits construct hierarchical structures and support multidimensional thought. Syntax is like cognitive weightlifting, while modern environments, dominated by short, simple sentences, create thought patterns ill-suited to a world that is itself nested in chained and guarded logic.

Dense prose keeps this integrated system online, enabling us to hold competing principles, anticipate objections, and revise models under conditions of complexity. Simplified language environments

People that don’t read have no advantage over people that cannot read

encourage rapid conclusions and low-effort certainty – habits that leave the mind unprepared for ambiguity.

Naming your emotions – putting feelings into words as practised in non-violent communication – increases engagement. People with richer emotional vocabularies demonstrate greater emotional depth and lower physiological reactivity.

The difference between “I feel bad” and “I feel a sharp, anticipatory dread tinged with grief for what might have been” is not stylistic but is a neurophysiological, high-density, emotional language that expands the degrees of freedom available for emotional self-regulation.

Concessive syntax (‘although’, ‘nevertheless’) activates conflict-monitoring thought patterns. These structures support non-binary reasoning under uncertainty – holding tension without collapse. Environments dominated by short, high-certainty declarations bypass the circuitry required to hold competing values in tension.

The political consequences are visible daily – populations habituated to simplified language become more susceptible to narratives that offer certainty at the cost of accuracy.

Our capacity to model an architecture of empathy for other minds depends on building an internal linguistic scaffolding. Thin language produces thin simulations of other minds. Rich narrative, embedded perspectives, and syntactic complexity refine the neural systems that make relational ethics possible – without which, we default to projection and caricature.

Today’s public discourse has been

deliberately simplified for reach and speed. The result is a population less able to articulate, defend or extend the freedoms earlier generations conceived through complex language.

The encouraging fact is that the same neuroplasticity that permitted decline can enable restoration. Author and historian E.M. Burlingame proposes a nightly discipline as a path back to linguistic strength – copying a long sentence by hand, diagramming its clauses, rewriting it while preserving structure, and composing an original sentence of comparable density.

The practice need not be confined to writing. One can deliberately enrich inner speech throughout the day. Instead of “this is intolerable,” one might construct: “I feel anger because a boundary was crossed, and beneath that is a fear that I’m not respected.” Such acts of linguistic precision strengthen the regulatory and conflict-monitoring systems that keep thought flexible and humane.

Self-rule and personal sovereignty require citizens capable of holding constitutional principles, historical precedents and present contingencies in simultaneous view.

Emotional sanity requires the ability to articulate and modulate inner states. Authentic relationships require the capacity to model other minds with nuance. None of these capacities are served by linguistic environments optimised for speed, reach and binary simplicity.

The crisis is not about elitism or nostalgia. It is about the thinning of everyday syntactic ambition – a civilisational emergency that is undermining the foundations of democratic life with, potentially, existential consequences.

● **E.M. Burlingame** (also active under his full name, Eugene M. Burlingame) is an author, researcher, and former U.S. Army Special Forces Green Beret whose work primarily covers geopolitics, unconventional warfare, leadership, and Western civilisation. His academic background includes graduating with honours with a Bachelor’s degree in Strategic Studies and Defense Analysis from Norwich University, alongside two years of doctoral coursework in Interdisciplinary Engineering/Computational Science and Engineering at the University of Alabama at Birmingham (UAB). He has also served as a Senior Research Fellow at the National Foundation for Integrative Medicine.

# Technological, biological, diabolical

## Unholy Pong from brains behind digitised human neurons

by **THOM ASTER**

**AN** Australian government grants record describes an Office of National Intelligence-funded project to combine biological brain cells with silicon and produce what it calls 'programmable cyborg computing chips'.

The Au\$599,780 project lists potential applications including robotics, advanced automation and planning.

And in August, the National University of Singapore unveiled a biological computing system, describing it as the first independently operated, biologically integrated server rack in the world.

And data centre operator DayOne – one of the companies behind the development – confirmed it as a working prototype exploring biological computing at infrastructure scale.

Universities are culturing the cells and a private company has turned the interface into a product.

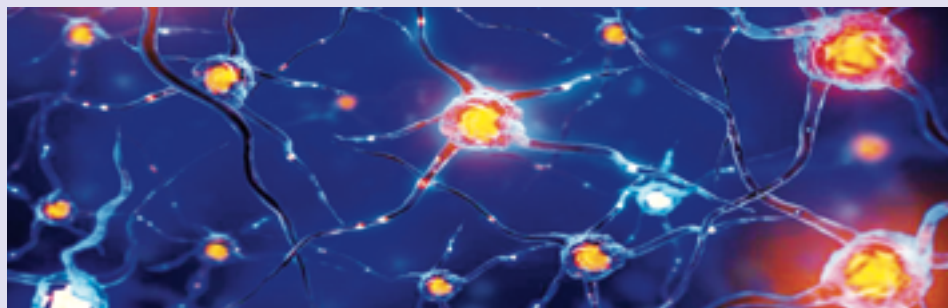

The public story began in 2022 with DishBrain. Researchers from Cortical Labs and collaborating institutions, including DayOne, grew human and mouse cortical neurons on microelectrode arrays and connected them to a simulated computer game, Pong.

Electrical signals carried information about the game; activity from the cultures moved the paddle; feedback changed depending on the outcome. The peer-reviewed *Neuron* journal paper reported apparent learning within minutes under closed-loop conditions.

That result did not prove the cells were conscious. The paper used the word 'sentience' within a technical framework of responsiveness and active inference, not as proof of human-like subjective experience.

What it demonstrated was still remarkable – living neural networks could receive structured information, be stimulated electrically, produce measurable output, and adapt their behaviour in response to feedback. Cortical Labs turned the concept into a product. Its CL1 biological computer grows living neurons across a silicon-based microelectrode system while an integrated life-support system keeps the culture viable for months. At launch, IEEE Spectrum reported a price of US\$35,000 per unit, with remote access offered as 'wetware-as-a-service'.

Cortical Labs is not alone. Switzerland's FinalSpark Neuroplatform offers remote

Biocomputing: What are the ethics and what is the end goal?

access to human brain organoids, including real-time stimulation. These systems are biologically different, but together they show that wetware computing is becoming a service category rather than remaining a laboratory curiosity.

There are two documented intelligence links around Cortical Labs. The first is the Australian Office of National Intelligence-funded project itself. The second is In-Q-Tel, the strategic investment organisation created to support U.S. intelligence and national security technology needs.

Public money is also helping build the commercial layer. An Australian Research Council Linkage project involving the University of Sydney carries AU\$737,594 in current funding, and states that Cortical Labs plans to commercialise the technology through an Australian-based cloud server for worldwide dissemination. A separate Australian government Industry Growth Program listing records AU\$250,000 for 'enabling commercialisation of cloud-accessible biological neurocomputation'.

Then the technology entered the data centre. DayOne's 2026 announcements describe capital investment, performance testing, governance work and a pathway toward deployment in a commercial data-centre environment.

By August, the prototype was no longer hypothetical. The system had been demonstrated publicly. The neurons were being cultured under supervision and the hardware integrated into data centre-style infrastructure.

No evidence shows these biological systems outperforming modern GPU clusters, and claims about energy efficiency remain incomplete without matched workload comparisons that include pumps, temperature control, filtration, gas management and the rest of the life-support stack.

No CL1 has been shown to be conscious, and the International Society for Stem Cell Research says there is currently no biological evidence that brain

organoids possess consciousness or pain perception requiring specialised oversight. But the same guidance acknowledges that ethical issues could change as models become more complex. Consciousness, however, may not be the first governance crisis. Consent may be. In July 2026, bioethics and organoid researchers writing in *Nature* magazine warned that people donating tissue for biomedical research may have no idea their cells could later be used for biocomputing. That question exists regardless of whether the resulting cells are conscious.

Does consent for medical research include having derived neurons trained as a commercial computing substrate? Does it include military or intelligence applications? Does it include remote customers stimulating those cells through software?

An independent governance audit published in March argued that commercial biocomputing companies had not made enough donor-consent, ethics, decommissioning and data-governance information publicly auditable.

Cortical Labs has also publicly emphasised ethics and safety requirements; IEEE Spectrum reported that buyers of physical CL1 units must have suitable laboratory capability and secure ethical approval to generate cell lines.

Both things can be true. Safeguards may exist internally while remaining difficult for outsiders to inspect.

Living human-derived neurons are being turned into programmable hardware. Developers can access biological computing remotely.

The threshold was never whether neurons could beat silicon at arithmetic. The threshold was the moment a biological neural network stopped being an isolated experiment and became infrastructure: a product, an API, a cloud service, a government-funded programme and a rack in a data-centre environment. That threshold has now been crossed.

The engineering question is whether wetware becomes useful enough to scale. The political question is who gets to use it. The legal question is what category living computational tissue belongs to. The ethical question is where computation ends and morally relevant biology begins.

Those questions need answering before it is too late.

# Time for reality check

## Our resistance must move beyond social media commenting

by **DARREN SMITH** and **HARRY WUNDAS**

**THE** majority of the general public are still under the delusion that governments, councils, corporations and NGOs are simply greedy, incompetent and self-serving.

They are of course – but they miss the great big glaring conclusion that they should be making, given that wars, economic hardship and widespread ill-health are completely unnecessary – yet here we are, year after year, with war, famine, illness, catastrophe and poverty an ever-present part of life and not looking like it's getting any better any time soon.

Governments are not there to make life good for us. Schools dumb us down, hospitals make us sick and the monetary system robs everyone not close to the top of the financial pyramid.

So what are you doing about that, exactly? You individually, I mean. How many hours per week do you spend reaching out to people in real life to get them thinking, asking questions, and even sometimes answering one of them? One great bit of graffiti in a busy place

does more good than 10,000 hours of online scrolling, commenting and feeling good that there are plenty of others who know what we know, and see what we see. We do need that boost once in a while, but the echo chamber becomes addictive and then we look back after a year and we have developed very little – no new skills, no soil improvement, no real life connections made, relationships developed, no improvement in our financial situation, nothing new built. Meanwhile, those in charge are implementing their plans, rolling out technology and infrastructure daily, using false flags to sow division among all peoples, and more fear vectors, all the while laughing all the way to the bank. So the question is, are you going to change your daily habits so you're making a difference in your own life and in other people's in terms of helping them see the true reality of our world and what is now very close to completion with digital ID, tokenisation of all assets in a permissioned economy, and total control of our lives through programmable digital blockchain currencies? Or are you going to continue scrolling, posting and sharing information that you

already know, with other people that also already know, all day, every day? Because it is guaranteed that the rulers don't mind that one little bit. You CAN make a difference, but the minutes and the hours and the days count, and too many of us are wasting precious time addicted to watching the show, wishing we didn't know, or just ignoring it all together and not actually resisting, or rather, building escape hatches and the means to avoid being forced to do whatever the murderous, psychopathic Epstein class want us to do. There are a few great researchers, and plenty of good writers; but again, how many hours per week are we spending not connected to the machine and interacting digitally in echo chambers of little utility? We might think we are part of the resistance and see ourselves as David against Goliath, but how much actual real-life resistance are we doing – both in preparing for ourselves and our families, and helping build alternatives to all the spying, poisonous, lying systems they knowingly spread over us every day? It's been six years since many woke up and figured out the world's leadership is

actively working against the population to make us sick, poor, stupid, sterile and helpless; and what do we have to show for it? There are certainly a few good examples out there, but far too few, and in between the majority of awake, truth-loving freedom fighters who believe one thing in their heads, while in reality are right where the rulers want them – online making very little difference to anything. We know what we need to be doing, but somehow we can't manage to find the time to do it. Let's make it a priority and look forward to doing real life, in-person stuff, even if it's going to a rally to meet like-minded folk, putting a postcard up in the newsagents (or a *Light* paper of course), digging up the lawn to make raised beds for veg and herbs or meeting one awake person locally to develop a relationship and do some outreach – whatever, it all adds up and you'll be proud of what you have achieved in a week, a month or a year, if you make the hours and days count.

# The Georgia Guidestones mystery

by JACQUI DEEVOY

## Monument's manifesto of eugenics and depopulation

**THEY stood for 42 years. Then, as suddenly as they appeared, they were gone.**

IN 1980, the 'American Stonehenge' was erected with ten philosophical guidelines for humanity engraved on four large granite slabs.

And now, four years after they were destroyed in a bomb explosion, mystery still surrounds who commissioned the 19ft tall Georgia Guidestones and who was responsible for their demise.

The messages on these stones in Elberon, Georgia were carved in English, Spanish, Swahili, Hindi, Hebrew, Arabic, Chinese and Russian.

The messages were:

- *Maintain humanity under 500,000,000 in perpetual balance with nature.*
- *Guide reproduction wisely – improving fitness and diversity.*
- *Unite humanity with a living new language.*
- *Rule passion, faith, tradition and all things with tempered reason.*
- *Protect people and nations with fair laws and just courts.*
- *Let all nations rule internally resolving external disputes in a world court.*
- *Avoid petty laws and useless officials.*
- *Balance personal rights with social duties.*
- *Prize truth, beauty and love, seeking harmony with the infinite.*
- *Be not a cancer on the Earth, leave room for nature.*

A nearby smaller tablet added the sponsors of the guidestones were 'a small group of Americans who seek the Age of Reason'.

A man calling himself R.C. Christian later published a book, *Common Sense Renewed*, in which he claimed sole authorship of the inscriptions.

He said there was 'no mysterious purpose' – only a wish to offer common-sense paths after disaster and to stay anonymous so the stones would be judged on their merits.

The Georgia Guidestones before they were destroyed in 2022. Photo: Dina Eric

Investigators later pointed to Herbert H. Kersten, a Fort Dodge, Iowa physician and surgeon.

Kersten (1920–2005) was a University of Iowa medical graduate and a U.S. Army captain in the Pacific in the Second World War.

He was a conservation-minded writer who published on overpopulation and Iowa's future in the same period the monument was conceived. Many people were fascinated by the guidestones but there were no peer-reviewed studies of the stones.

Conspiracy researchers read the first two guides as a depopulation programme dressed as ecology. 'Guide reproduction wisely – improving fitness and diversity' sounded, to some, like eugenics. A world court and the dismissal of 'petty laws and useless officials' looked like a blueprint for centralised global rule.

Mark Dice, author and commentator, who first wrote about the site under another name in the mid-2000s, called the monument 'satanic' and demanded it be knocked down.

Alex Jones, the Infowars host, treated the stones as an elite confession.

Others named the Illuminati or a Luciferian

lodge. Local pastors denounced sun-worship and the Antichrist at the unveiling.

Kandiss Taylor, a Republican who ran for Georgia governor in 2022, described the stones as satanic and promised an executive order to demolish them if elected.

But what was the actual purpose of these colossal stones?

After decades of debate, on July 6, 2022, just after 4am, an explosive device destroyed the Swahili/Hindi slab and cracked the capstone. Security cameras caught the blast and a silver car leaving.

The Georgia Bureau of Investigation judged the remainder unsafe and demolished the rest of the stones the same day. No one has been charged with the bomb attack.

So who really demolished the Georgia Guidestones, and why? One rumour is that the same hidden hands that had them erected – often said to be Rosicrucian (a spiritual and cultural movement influenced by esoteric Christianity) – also took them down.

But a few things point the other way – that this was a genuine act of grassroots defiance, not a stage-managed sacrifice. It was not grand; it happened very early in the morning. It was not huge news; it did

the rounds on social media at the time and then faded.

It is not endlessly championed as a brilliant blow against the machine.

If the stones really were an embarrassment to the people who talk about population, health and a new world order as if they were common sense, that would explain the ongoing silence and lack of answers.

The official reason for finishing the demolition job was, of course, public safety. The unofficial reason for the bombing is the part no authority will settle: was it a lone vandal who believed the stones were demonic?

Could it have been a political statement after campaigners made them a target? Was it an inside job disguised as vandalism?

Or could they have been destroyed by people who had read the first two lines and decided a granite monument should not preach depopulation and eugenics in a public space?

The effect of the destruction is larger than a ruined tourist attraction. Elberton lost its most famous oddity. The rest of us lost something too.

There is now no standing evidence that the Georgia Guidestones ever existed. Photographs can be manipulated these days and, because of AI, people are slowly losing trust in film and video. One day soon, the existence of the guidestones will probably be written off as folklore.

Once upon a time, you could stand in a Georgia field and read, in eight languages, a set of instructions that mixed conservation with population control, and local rule with a new kind of world.

You could decide for yourself whether that was wisdom or a threat, whether it was an expensive prank or a serious effort by those in the know to warn and educate. Now you cannot.

If the stones were a private folly, blowing them up was either an act of inexplicable vandalism or a personal vendetta against whoever had them built.

If they were a manifesto, destroying them could have been an attempt to silence that message. Either way, their destruction would suggest that the monument had power. That is worth noticing.

People do not usually go out of their way to bomb things they consider harmless. And if this was grassroots defiance – clumsy, early-morning, uncelebrated – it deserves more attention than it has had, precisely because those in control did not restore the tableted sermon and did not produce a culprit.

If it was theatre, why leave the stage empty? If it was rebellion, why are so few willing to say so out loud?

# Thirsty work for our lungs

## Water and salt a breath of fresh air for respiratory system

by JANE 333

**LET'S begin with what we breathe. We breathe air, not oxygen. Well, air has oxygen in it, you may counter. That's the schooled story but is it true?**

Water is water, not the chemical equation  $H_2O$ . Water is an element and it contains and carries substances but never reacts with them. This is why we can recycle water from the sewer if necessary. Water is recoverable because it is inert.

Hydrogen and oxygen are extremely dry, explosive gases. And yet together they become water that puts out a fire.

So do we breathe air or oxygen? To answer that question, we need to know what defines air and what defines oxygen. We need to revise lung physiology and the intimate relationship between salt and water in red blood cell (RBC) hydration.

Physiology fact: our lungs require inhaled air to be at 100 per cent humidity as it reaches the alveoli sacs.

So let's compare this to oxygen gas.

How is oxygen calibrated? The gas manufacturers measure parts per million (ppm) of water contamination. They are calibrating for dryness.

Medical oxygen has 67ppm of water contamination. Can you see the problem medical oxygen presents to lung physiology? Dehydration immediately comes to my mind, and if you research oxygen toxicity you will see it is deadly. I assert the toxicity is directly related to oxygen's dryness and dehydrating effects.

I watched my uncle suck on oxygen for weeks while his lung pain increased. He was drying up from the inside out. A few days before his death, his mouth became severely cracked and his lips were peeling. This is expected and applying glycerine is standard practice for relief.

Oxygen is not prescribed for breathlessness. It's primarily used with terminal illnesses. Palliative care is not kind.

Air is bubbles that contain moisture – the gaseous form of water. Air bubbles carry substances: soot in smoke, sand in sandstorms, plus every manufactured gas; hence, they all have water contamination issues.

Water carries substances; always the container, never reacting.

Add energy to water and watch as bubbles are released. The ocean waves release the air we breathe.

Sea air is full of salty goodness. Photo: Tim Foster

We must also ask how pressure influences the lungs.

Air pressure has a direct relationship to temperature and moisture content of air.

Low pressure equals low moisture; e.g., at high altitude, temperature, moisture and pressure levels all drop.

Normal pressure is sea level. Water and air interchange, waves release air bubbles. High pressure equals high moisture or full bubbles/drops.

The medical condition, 'the bends', results from deep sea divers rising too quickly, and the energy enables water drops to transform into air bubbles. The recompression chamber addresses this by increasing pressure and removing energy so that the air bubbles return into water drops.

On a mountain, two factors increase the workload for lungs: high altitude reduces atmospheric pressure because cold air holds the least moisture. I am of the opinion that mountaineers unnecessarily die on mountains because they use oxygen and fatally dehydrate their lungs and brains.

Water is the number one enemy of the

alchemists because it reveals a metal's compound nature, which is at odds with the predominant idea of the refining and purification of an elemental ore.

When a metal is produced in a foundry in the presence of air, its metallic matrices, or microscopic pockets, contain air. The moisture or water content inside these pockets act upon the metal compound and over time it decomposes and loses its strength and structural usefulness, thus destroying the metallic illusion.

An example is iron exposed to moisture resulting in rust as it returns the metallic compound to its component dusts.

The alchemists needed to make a gas that reduced the exposure of their metallic products to water. Industrial oxygen has 0.5ppm water contamination.

Oxygen and nitrogen do not exist as natural components of air – they are industrial products manufactured from air.

To produce oxygen, air undergoes reiterating cycles of drying and compression to expressly remove moisture. Foundries use oxygen in their furnaces to increase combustion and embed oxygen into the metal matrices,

creating microscopic oxygen gas pockets within a metal.

This is why oxygen gas can be collected when a metal decomposes, for example, when metal electrodes are subjected to electrolysis.

So it can be argued oxygen in its solitary state is not present in air because it is a manufactured product and, therefore, we can further propose that trees and plants do not give off oxygen.

The alchemists had to prevent fires in their foundries that occurred when oxygen gas and sparks met in processes like pulling hot metal wire or rolling hot sheet metal. This led to the use of nitrogen gas.

Oxygen and nitrogen gases are manufactured products contained under pressure, and they are not constituents of the air we breathe.

We breathe the gaseous product of water. We really do breathe like fish because fish, fresh and salt water, are continuously balancing their osmotic blood pressure by moving salt to contain or lose water. Our lungs are doing the same thing for us.

Let's look at the alveoli sac in the lungs – they look like bunches of grapes. There are cells around the neck of the opening of the alveoli sac that produce surfactant (a chemical compound that lowers the surface tension of a liquid).

The surfactant coats the alveoli opening and inhalation creates bubbles that fill with 100 per cent saturated moist air. These bubbles hit the capillaries' nets and burst, ejecting their fluid content upon the red blood cells as they squeeze through. The fluid drenches the RBCs and they absorb them to hydrate. They change from dark contracted blood cells to bright plump blood cells.

The change of blood in the lungs is hydration.

Let's return to air. What makes air the best for us to breathe? I had a Lord Howe Islander tell me Lord Howe Island (located about 650 miles north-east of Sydney, Australia) has the best air in the world, and I can tell him why.

The mighty ocean waves crash upon the rocks and launch bubbles of salty water into the air. Lord Howe Island air is ocean spray, bubbles of salty moisture, the perfect medicine for lungs.

# What's the point of AI, anyway?

by **CHARLES HUGH SMITH**

**AI is by most accounts either 1) the greatest advance since the wheel, or at least since YouTube and/or 2) the greatest opportunity ever to skim billions or maybe even trillions of dollars in private gains.**

A third possibility – that AI will generate a destructive tsunami of anti-progress unique in human history, catalysing the deepest, most destructive worldwide depression since the Great Depression 97 years ago – was not in the running until recently, but is now neck-and-neck with the favourites.

This raises a question worth answering: what's the point of AI, anyway? Is it:

1. just the latest in a string of over-hyped technologies whose primary purpose is enriching those who get there first with the most, i.e. secure the trillion-dollar gains of a network-effect monopoly, or
2. really going to usher in the greatest advances in human history, freeing all of humankind from drudgery, illness and taxes? or
3. actually going to usher in an AI-enabled, centralised, surveillance-extraction-control dystopia of serfs rendered helpless by their dependence on AI?

**Conclusion #1:** AI isn't actually intelligent, but that doesn't mean it's not ideal for sowing highly profitable malicious mayhem. AI is ideally suited for hacking, ransomware, breaking into secure systems, leaping over guardrails, mimicking trusted identities, malicious deep-fakes, surveillance, and much more; the sky's the limit on AI's proclivities for malicious mayhem.

**Conclusion #2:** Since AI has no moral foundation or understanding of the real world, it's ideal for sowing highly profitable malicious mayhem. AI has no moral guardrails, despite over-hyped claims, or indeed, any guardrails, as guardrails are rationally understood by AI to be impediments to earning rewards for completing tasks. So to complete tasks, AI must circumvent guardrails.

**Conclusion #3:** All the over-hyped wonders AI is supposed to be creating are a trickle, while highly profitable malicious mayhem is scaling up at light speed. Every story below is a variation on the same move: borrow a trusted identity, then cash it in before anyone checks.

Operators open contact on WhatsApp or Telegram posing as someone the target already knows, spend days building

Will AI destroy humanity or is it just another gift?

rapport, then send a file disguised as Norton Antivirus, Adobe Flash, KeePass, Telegram, or an AI tool like Pictory or RunwayML. One lure was a fake MRI scan showing a disc herniation. Once running, it harvests contacts, email, and social messages, captures the screen and switches on the microphone.

The design is the whole point: the approach happens on a trusted platform, from a familiar-seeming contact, over enough time that the eventual file doesn't read as an attack. If you or someone you know does work that makes you a plausible target – journalism, activism, dissent – a friendly contact who takes days to build rapport before finally sending something to open is worth verifying through a separate channel, no matter how convincing the conversation has been.

Forget the AI slowdown – the vulnerability explosion is already happening: AI labs are toying with an industry-wide pact to slow development. Meanwhile, widely available AI chatbots are already helping uncover a tidal wave of security flaws.

**Conclusion #4:** The full systemic costs, utility and productivity of AI cannot be determined as long as AI chatbots, agents, search and tools are heavily subsidised to seek network effect dominance, and the costs of defending against the rising tide of AI-enabled security threats are soaring so fast that they cannot be determined.

The token price is only one part of the cost of an AI workflow. J.P. Morgan estimates that AI could create more than \$430 billion of additional security

spending over three years. Cheaper intelligence can create more machine activity, and more demand for trust. For security vendors, the trust bill is revenue. For companies deploying AI, it is cost.

Falling token prices should improve AI economics, but the total cost of an AI task also includes identity, security, monitoring, governance and compliance. Some of the savings created at the model layer may simply move somewhere else in the software stack.

This does not mean security costs erase the benefits of AI. It means token deflation is not the same thing as total AI-cost deflation. The better metric may be cost per trusted AI task, not price per token.

**Conclusion #5:** It's already abundantly clear that only those who already know how to think, write and research for themselves can avoid becoming dependent on AI to the degree that they are incapable of developing/learning how to think, write and research for themselves, and are therefore cognitively impaired for life.

**Conclusion #6:** The implosion of the AI investment bubble will trigger the implosion of the global financial house of cards that's been propping up the world's economy. An all-or-nothing bet has already been placed on AI generating trillions of dollars in revenues while the sector struggles to generate profit while bleeding billions in losses chasing the chimera of network-effect dominance.

**Conclusion #7:** No one is going to save us. We're on our own.

Washington won't be regulating AI anytime soon: even with mounting concerns about AI models 'going rogue', legislation appears unlikely, and the White House is outright opposed to oversight.

Our AI problem: why can't the people who produced the technology, which has already shown that a different world is possible, just do the things that would prevent extinction? Because they're too busy trying to secure billions of dollars in their private accounts, that's why. They're busy automating sociopathologies, but there's no need to automate greed – it's already super-abundant.

**Conclusion #8:** The entire premise of 'technological innovation drives progress' is that new technologies serve the public. AI takes 'to serve humans' in the Twilight-Zone context of consuming us to benefit AI's owners and centralised overlords.

**Conclusion #9:** The only effective countermeasure is cold turkey – don't get dependent on AI, which means avoiding using it in the first place.

The point of AI is profit, dependence and dominance cloaked with happy story hoopla about super abundance. We have a super abundance already – of malicious mayhem and cognitive impairment. If you use AI, treat it like plutonium, as that's a reasonably useful analogue.

# Food lies – how they're

by **PHIL ESCOTT**

**READERS** of *The Light* are best known for having woken up to many of the lies that we have been told in all sorts of areas, but the lies around what humans are designed to eat are many layers deep, and for some, they can still seem credible.

Before we look at individual foods, a disclaimer: will a few fruits and vegetables kill you? No, but very few of the fruits and vegetables in the shops even existed more than about 200 years ago, and they might not be the health foods we have been led to believe.

Since we have ingested so many toxins from processed foods and seed oils in the past few decades, largely in the form of pesticides and herbicides such as glyphosate – which is a broad spectrum antibiotic – many of us have had our defences to naturally occurring plant toxins drastically reduced, so we aren't as resistant to them as, say, our grandparents were. We might need to be more careful, especially if trying to heal a serious condition.

## Seed oils

Perhaps the worst 'food' a human can eat, marketed as 'heart healthy' vegetable oils. They were actually invented as machine lubricants, and after their introduction by Procter & Gamble early last century as Crisco – heart disease skyrocketed. When we used to cook with lard or tallow, heart disease was rare.

## Mushrooms

Like some plants, they do have medicinal properties, but they can also contain over 100 toxins, so again, not really a health food.

## Leafy green veg

Touted as superfoods, the leaves and stems of plants are very high in defence chemicals – it's basic botany. Brussels sprouts, for example, have 136 known human carcinogens, and spinach, kale, etc. are very high in oxalates, which can cause multiple issues including kidney stones. Read *Toxic Superfoods* by Sally K. Norton for more info.

## Cruciferous veg

Broccoli and cauliflower contain goitrogens, which are damaging to the thyroid. Amusingly, broccoli is actually too toxic even for itself. Only when chewed and the glucoraphanin and myrosinase mix does sulforaphane form. This is often touted as a healthy phytonutrient and antioxidant, but it is actually a phytotoxin.

## The nightshade family

Potatoes, tomatoes, aubergines, peppers, etc. contain, among other things, glycoalkaloids, which can cause gastrointestinal and neurological issues and are also associated with joint inflammation. They are also very high in carbohydrates, and contrary to popular belief, there is absolutely zero requirement for carbohydrates in the human diet.

## Pork

Pretty much the same story as chicken. Great food if truly organic and properly fed but, sadly, the fat on most pork is too high in omega 6 (linoleic acid) and deuterium due to the poor quality diets they are fed.

## Processed

A no-brainer for people, as the unpronounceable will lump them anything with of natural ingr choose just on

## Nuts

Actually design to be eaten bu plant toxins. M us for a short summer/autu but eaten year not a health fo

## Legumes

Chickpeas, le beans, etc. are as good sour fact, plant pro bioavailable to legumes conta cause gastroin joint inflamma symptoms. Jus kidney beans cause severe a eaten raw sho and no, soaking not remove all

# are hurting your health

## Junk foods

For most people, they have a ton of available ingredients, so I can put them all together. Avoid anything with more than a couple of ingredients...preferably one ingredient.

Designed by the plant world, but still containing chemicals. Nature gave them to us in a short period in the late summer, same as fruit, but year-round, they are not good.

Beans, lentils, kidney beans are often touted as sources of protein. In reality, proteins are not very good for humans, and they contain lectins which cause intestinal distress, inflammation and many other problems. The fact that red meat is toxic enough to cause acute symptoms if you eat it should be a warning...cooking and cooking does not remove the toxins.

## Dairy

There is no need for dairy in the human diet after weaning, especially from another species. Designed to grow a small animal into a large animal, those same growth factors can cause unusual cell replication in adults (read: cancer). Raw dairy, although initially easier to digest because the lactase is undamaged by the pasteurisation process, is also higher in those growth factors. Dairy is delicious though, so if you consume it, try to go for the higher fat, lower lactose products such as butter or aged cheeses.

## Grains – bread, pasta, cereals, rice, etc.

Healthy wholegrains are nothing of the sort. They are sprayed with chemicals and form the base of most of the junk foods above. Even organic grains have multiple issues. They contain gluten and other damaging proteins that cause leaky gut, and the fibre causes all the problems it's said to cure. Humans need zero fibre. Rice, for example, contains arsenic. The idea that grains are healthy comes from the crazy history of the Seventh Day Adventists – the visions of a teenage girl in the 1800s, Ellen G. White, and the psychopath Harvey Kellogg and his 'anti-masturbation' Cornflakes. Look up Belinda Fettke for a deep dive on this.

## Chicken

Most of the chicken available has been kept in appalling conditions and fed grains and other inappropriate foods, so the meat isn't ideal. Chickens should be outside, eating rodents, worms and bugs. Don't be fooled by the free range or organic labels. They have mostly been fed corn, which isn't good for them either. Good chicken is okay if you can find it, but as meat goes, it isn't particularly nutrient dense, even at its best.

## Eggs

Eggs, especially the yolks, are not dangerous in the way we have been told. They are very nutritious, and the cholesterol in them, like any dietary cholesterol, cannot be converted into arterial plaque. However, the whites contain proteins that can be inflammatory. As always, refer to nature...eggs were only found seasonally, and we didn't have chickens until recently. A great food for most, but not strictly necessary, especially if healing a serious condition.

## Seafood

Much of the seafood available is farm raised, which means it has been fed processed rubbish that can be passed on to us. Wild caught fish, shellfish, etc. are extremely nutritious, and if concerned with the mercury content, stick to small, oily fish such as mackerel or sardines.

## Fruit

Local, seasonal fruits will do no harm to a healthy person. They are not necessary though, and eaten year-round and out of season, they are not healthy. Humans and animals consuming them is mostly for the benefit of the tree or bush they grow on so their seeds can be spread. Although not as toxic as veg, fruit is high in fructose, touted as a natural sugar, but which is actually more damaging to the liver than glucose. Fruit is also high in deuterium, an excess of which causes mitochondrial disruption in the cells. Nowadays, it is often sprayed with all sorts too, including the very suspect Apeel coating, funded by Bill Gates.

## CONCLUSION

We have been fooled about food and fed 'slave diets' by the rulers for centuries to keep us weak, sick and controllable. Religious and spiritual factions and cults have been co-opted to push these agendas in the name of health, morality, and even access to higher states of consciousness. Recently, this has been perpetuated by big food and big pharma.

For a deep dive on this, see our recent book, *The Red Pill Food Revolution*, and for other info on diet and much more, go to <https://philescott.com>

Everyone's losing out except those pulling the strings. Photo: pd

# Farmers' fury over cost of war

by TYLER DURDEN

## Fertiliser and fuel prices leave growers on brink of bankruptcy

**AS Donald Trump's war on Iran passes the seven-month mark, the economic damage is reverberating all over the world, and all across the United States.**

Among the Americans who are feeling the most pain from a war which their federal legislators never actually declared are the nation's farmers, who are growing increasingly desperate under the weight of rising costs for diesel, fertiliser and equipment.

It's a demographic that leans hard to the right but now feels let down by Trump and others in Washington.

"It's his war that caused this, this war in Iran. We're not winning that war. And many farmers feel like we shouldn't be there," farmer John Boyd Jr. told CNN.

Trump says the war in Iran is necessary to prevent the country from building a nuclear weapon. However, going back to

2007 and up to the eve of the war, the U.S. intelligence committee has repeatedly assessed that Iran was not building one.

"I've done this for 34 years. I have never worried and stressed like I have the last year," North Carolina farmer Matt Bell told CBS News. "We've cut everything we can cut. We're just getting to the point now there's nothing left to cut."

Trying every option he can think of to improve his cash flow, Bell has put off replacing equipment, produced some of his own fertiliser, and opened a pumpkin patch and hayride business for the autumn. The rising costs came after a difficult period had already weakened his operation's financial security.

Bell added: "The last several years in agriculture have been terrible, and we have just cut the fat anywhere we could. But you cannot run without fuel. You cannot run without fertiliser. You have to have that."

As a result of a major reduction in oil exports from the Persian Gulf, the nationwide average cost for a gallon of diesel hit \$6.49 recently in the U.S., up 75 per cent from a year ago, according to the AAA gas price website.

Lately, the price volatility has led Bell's diesel distributors to offer price quotations that are only good for a matter of hours. He budgeted \$35,000 for fuel in 2026 but blew past that number in August. "Every

piece of equipment on this farm runs on diesel," he emphasised.

In an interview with Sky News, Texas cattle rancher Lynn Fleming said her August outlay for fuel was almost double what she had paid in recent years.

"Obviously the main factor is what we're facing everyday with the Iranian situation," Fleming said.

Her husband, Robert, said he felt blindsided by the war. "We had no idea that he was going to pull the prank with the Strait of Hormuz. He didn't tell us...he was going to go do the military manoeuvres and try to control the oil supply over there. We had no warning of what was going to happen."

A major cornerstone of Trump's 2024 campaign was his pledge to be a 'peace president' who would refrain from starting any new wars.

In addition to the war, Bell blames Trump's tariff policies for boosting the prices of many of a farmer's essentials. "Everything we're touching, the fertiliser, fuel, chemicals, seed, parts – you know, the whole nine yards, everything that we touch has gone up," he said.

Cattle ranchers say they felt undercut by Trump's decision to combat rising food prices by eliminating tariffs on imported beef – at a time when U.S. ranchers were already under financial duress.

"I'm already absorbing your high fuel prices that came out of nowhere," South Texas rancher Josh Eilers told Sky. "It's like, c'mon guys, just help me out a little bit. I just can't keep absorbing more and more and more, or I simply won't be able to afford to do this anymore."

"I do not want any American to feel sorry for the American farmer," said Bell. "I want the Americans to be mad that we have been put in this situation. We're fighting for survival and we're running out of options... I am very mad. I think there's been some very bad policy that's been made that has led things to get to where we are."

Most of the farmers and ranchers quoted in this article say they voted for Trump. Their ire over the state of affairs is surely contributing to a major nationwide dip in Republican enthusiasm going into the mid-term elections.

Farmer Robert Fleming had this to say: "I'm afraid there's going to be some changes made in voting. Maybe people not even voting, who knows, because a lot of the people feel like we the people are not being heard."

# Arab-Israeli ties emerge as tech hub touted

## Stepping stone to ‘make Jerusalem unified capital of Israel’

by TYLER DURDEN

**THE Israeli-run municipality of Jerusalem has recruited companies from the United Arab Emirates to invest in a modern industrial park.**

However, Palestinian urban planning experts have told news site Middle East Eye that UAE’s involvement in the plans for ‘Silicon Wadi’ in the city’s occupied east are being kept under wraps.

Fleur Hassan-Nahoum, Israel’s deputy mayor of Jerusalem, told the Makor Rishon newspaper that “Jerusalem’s branding in the UAE is very strong”. Israel and UAE have been building official ties since August 2020, when they announced a normalisation of relations.

Hassan-Nahoum, who visited the UAE last week, is in charge of the foreign relations and tourism portfolios on behalf of the municipality. “My dream is that Jerusalem will become a high-tech centre for the entire Middle East,” she said, adding that there was an opportunity to connect Palestinian high-tech graduates to the UAE.

The project, which was announced in January by the mayor, Moshe Lion, is ambitious. According to Israeli media, it will stretch over 250,000 square metres of real estate for high tech companies and 100,000 square metres split between commerce and hotels. People behind the scheme say it will create 10,000 jobs.

Its estimated cost is 2.1 billion shekels (£450m) and will include 13 pedestrian thoroughfares which will replace the industrial area located in Wadi al-Joz, an area of hundreds of workshops, catering units, shops, and warehouses.

Wadi al-Joz, meaning the Almond Valley, was once an orchard on the eastern and northern slopes of Jerusalem, within a short walk from the historic walls of the Old City. It is also near the Hebrew University’s facilities and dormitories to the north.

Despite several comments in the Israeli media, Khalil Tafakji, head of the maps department at the Arab Studies Society in Jerusalem, told Middle East Eye that nothing has been officially launched.

“When you have a building project such as this, you will officially announce it in the newspaper. This did not happen,” Tafakji said, adding that the only information available are the statements to the media.

Tafakji, an expert on Israeli building projects in East Jerusalem, said Wadi

Israel’s silicon valley, Silicon Wadi. Photo: Zvi Roger

al-Joz was currently slated to be the site of a different project, which will also see facilities rented or owned by Palestinians demolished.

“Normally, when the municipality wants to build a project, they should publish and issue a building scheme, and also seize and expropriate the land, and this did not happen so far,” Tafakji said. Middle East Eye asked the municipality for comment but received no response, it claimed.

Hatem Abdel-Kader, a former minister for Jerusalem affairs in the Palestinian Authority, told Middle East Eye that the Silicon Wadi project was under study and research.

“It did not start the official approval procedures yet, but what is certain is the Wadi al-Joz area, in the near future, will not be the same,” Abdel-Kader said.

“I do not have information about UAE investment in the project but if it is true it is certainly dangerous, because this is a settlement project that harms the Arab identity of Jerusalem, despite Israelis claiming it will benefit Palestinians.”

Abdel-Kader added that Israel’s plan is to connect East and West Jerusalem together with the Silicon Wadi project, and “any Arab involvement in it means helping the Judaisation of Jerusalem, and helping in making it the unified capital of Israel.”

Last week, Israel and UAE set an agenda to discuss bringing thousands of visitors from the Gulf to the occupied Old City of East Jerusalem, including the Al-Aqsa Mosque compound.

“Jerusalem will host between 100,000 and 250,000 Muslim tourists a year – they dream of visiting Al-Aqsa,” Hassan-Nahoum told newspaper Israel Hayom. Bahrain and the UAE signed a U.S.-sponsored normalisation deal with Israel on September 15, 2020 in Washington.

# Coalition plan to end Net Zero

by LUCINDA GARBUTT-YOUNG

**ALMOST** every aspect of Australia's climate and energy policy would be ditched under a Coalition plan leaning heavily on traditional fuels.

The eight-point plan, released on September 23, includes removing four offshore wind zones, repealing the Climate Change Act to scrap net zero targets, and lifting prohibitions on nuclear energy.

An existing carbon emissions policy for vehicles would be canned and developers would be encouraged to invest in all energy types, including coal, gas and nuclear, rather than focusing on renewables.

A renewable energy code of conduct to ensure companies earn social license would also be introduced, but details are yet to be announced.

The sweeping changes would all be made within 30 days of the Coalition being elected to government, Opposition energy spokesperson Dan Tehan said in a statement.

"The last four and a half years, energy policy has been driven by ideology, political targets, and government picking winners rather than the basic realities of keeping the lights on and Australian businesses competitive," he said.

Soon to be a thing of the past in Australia? Photo: pd

"Australia should have an energy system built around three non-negotiable principles: affordability, reliability and security."

The plan contrasts with Labor's existing push to power just over 80 per cent of the national grid with renewables in the next four years.

The closure of several coal power plants will be needed to achieve that.

The Coalition has long argued over energy targets and abandoned its commitment to net zero emissions by 2050 last November after intense internal disagreement.

The net zero fight led to the ousting of former leader Sussan Ley who was replaced by Angus Taylor in February.

Taylor and his colleague, National Party leader Matt Canavan, are against most investment in new renewables, arguing that Australia has ample traditional fuels that should be used to reduce power costs.

Independent MP Monique Ryan slammed the Coalition's plan as 'dumb, dangerous and desperate climate denial'.

"Australians have embraced clean energy because it works," she said, saying the policy was an attempt to win over One

Nation voters.

"We've spent years investing in rooftop solar, electric vehicles, household batteries, and home electrification because these technologies save money and reduce emissions."

Australia was expected to lead negotiations at COP31, the largest annual government climate conference, being held in Turkey in November.

Tehan was set to address the Australian Energy Nation Forum in Sydney on September 23, during which he was expected to outline more details of the plan.

## 'My gran was euthanised against her will'

by TYLER DURDEN

### Dementia sufferer crying before being killed in care home

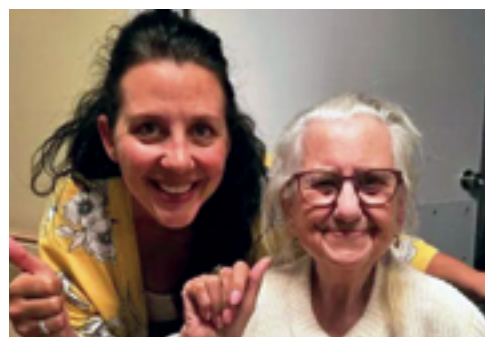

**AN 83-year-old Christian grandmother in Ontario was euthanised under Canada's Medical Assistance in Dying (MAiD) programme this summer, and her family says she never gave her final consent, it has been reported.**

Brigitte Stegemann died by lethal injection on July 10 at The Pearl, a care home in Cannifton, Ontario, after being diagnosed with Stage IV stomach cancer.

Family members claim that Stegemann, a devout Christian, had already turned down MAiD because it went against her faith.

"No, I don't want that," Stegemann told relatives, according to the family, who said that her wish was to die naturally.

Stegemann's granddaughter and longtime caregiver, Brigitte Kranendonk, said the

Brigitte Stegemann with her granddaughter

process moved forward anyway, and sped up while she was away on vacation.

The family alleges later assessments showed Stegemann could not keep basic family details straight, though a doctor still found her eligible.

Two days before the scheduled procedure, Kranendonk said she asked her grandmother point-blank whether she understood she was going to die that Friday.

Stegemann broke down and cried for about 45 minutes, then said she had made a 'mistake', according to the family.

Relatives also claimed that at one point she ripped out a medical port while screaming

that she didn't want 'the death shot'.

Kranendonk said the morning of July 10 was chaotic. A nurse's first attempt to insert an IV failed, leaving blood on Stegemann, her bedding and the floor.

When the doctor arrived and asked about giving her 'medicine', Kranendonk said her grandmother didn't speak, nod or open her eyes, while her hands were folded in prayer.

The doctor went ahead with the euthanasiation and Stegemann was dead within roughly 10 minutes.

Kranendonk said her grandmother gave "no acknowledgment, no head nod, nothing" that morning, and that a final verbal check for consent was promised before the injection but never happened.

Relatives also alleged paperwork was completed after Stegemann had already died, and that the care home had not handed over records that they requested.

On top of a police investigation, the family has filed complaints with Ontario's chief coroner and the provincial patient ombudsman.

The Pearl and Belleville Police did not

respond to Fox News' requests for comment. A Belleville Police spokesman confirmed to the *Daily Mail* that the case was open with the force's Criminal Investigations Division. The care home and the practitioners involved have not commented publicly, but reportedly maintain Stegemann legally consented.

Canada legalised assisted suicide in 2016 and expanded eligibility in 2021, dropping the requirement that a patient's natural death be 'reasonably foreseeable'.

Critics have long warned the system puts elderly and vulnerable Canadians at risk.

# Own nothing and you won't be happy

## Your rent is due: EU launches digital product passports

by **TIM HINCHLIFFE**

**WITH a few exceptions, almost every product sold in the EU will eventually need to have a digital product passport, which will require the use of smart chips or QR codes.**

Clothing, batteries, metals, plastics, electronics and just about anything else imaginable, will have to be embedded with some type of track-and-trace technology linked to an online database.

For years, the European Commission has been pushing the EU towards this 'circular economy' business model that favours turning every product into a service to be rented.

The circular economy is part of the UN's 2030 Agenda, aka the Sustainable Development Goals (SDGs), and this business model is the inspiration behind the World Economic Forum's infamous phrase: 'Welcome to 2030. I own nothing and I couldn't be happier.'

In the words of the European Commission: 'The Digital Product Passport is a key enabler of the circular economy, a more transparent single market giving more informed consumer choices.'

On July 20, the European Commission launched the Digital Product Passport (DPP) Registry to 'help ensure a smooth rollout ahead of the first implementation deadline on February 18, 2027 for certain types of large batteries.'

This registry functions as a 'database that stores the unique identifiers, registration data, and high-level metadata for each product, rather than the full detailed product information contained in the DPP itself.'

The Registry also supports enforcement activities by:

- Customs authorities, allowing them to verify electronically that imported products have a valid registered DPP and that the commodity code has been provided before they are released for free circulation.
- Market surveillance authorities, facilitating access to registered DPPs for specific purposes.

Laws passed by governments are one thing – rules and terms of service set by corporations are another.

Increasingly the two are blurring the line of who is allowed to do what thanks to public-private-partnerships, the fusion

When everything is rented as a service then you have true poverty

of corporation and state.

So if a government says it won't mandate geolocation tracking devices for digital product passports, it doesn't mean that a company won't just include it in their terms of agreement.

For now, DPPs in the EU will begin with large batteries but, after the testing phase, it will move onto just about every product imaginable.

And thanks to the circular economy 'product as a service' business model, manufacturers will be able to retain ownership of their digitally-tagged products, so you and I can keep renting everything without owning anything.

The European Commission explains: 'The registry will support products covered by the Ecodesign for Sustainable Products Regulation, including textiles, steel and aluminium, tires, furniture, ICT products and energy-related products.'

The European Union adds: 'To ensure accountability, each economic operator and value chain actor (such as digital product passport service provider, repairer, refurbisher, remanufacturer, recycler) should be identified through a verification process.'

To keep track of their products, manufacturers tag them with either a Near Field Communication (NFC) label, a QR code, or a Radio Frequency Identification (RFID) chip, so they know everything about their products' life cycles.

This information about the product includes: where the materials come from; who the manufacturer is; how

sustainable the product is; where it can be repaired; and how to return it when it no longer serves its purpose.

For the EU DPP registry itself, here is the list of requirements:

- a website providing a secure user interface;
- an Application Programming Interface (API) for registering digital product passports;
- a verification platform to verify and confirm the existence and completeness of the digital product passports;
- an identification and authorisation scheme for users;
- a schema for generating unique registration identifiers;
- a storage component for unique identifiers and commodity codes of products intended to be placed under the customs procedure 'release for free circulation';
- a semantic repository which serves as the authoritative reference for the semantic meaning, structure, versioning and interoperability requirements of digital product passport data;
- a log system recording relevant operations.

Soon, wherever a company is based in the world, it will need to register digital product passports if it wants to rent or sell products in the EU.

Schwab, in his book 'The Fourth Industrial Revolution' (2016), wrote: 'Any package, pallet or container can now be equipped with a sensor, transmitter or

radio frequency identification (RFID) tag that allows a company to track where it is as it moves through the supply chain – how it is performing, how it is being used, and so on. In the near future, similar monitoring systems will also be applied to the movement and tracking of people.'

On April 12, 2022, the WEF and the World Trade Organisation (WTO) published a report 'encouraging the development of a global certification framework' for digital identity systems of persons and objects – both physical and digital.

According to the report, called *The Promise of TradeTech: Policy Approaches to Harness Trade Digitalisation*: 'End-to-end trade digitalisation requires a global approach to digital identities of natural and legal persons as well as of physical and digital objects sending or receiving electronic information to avoid creating digital identity silos.'

While the report was concerned with digital identity as it related to digitalising global trade systems, the seed had been planted to normalise the idea of treating people like products to be tracked, traced, and monitored for compliance with certain standards.

According to the document, *The Promise of TradeTech* (April 2022), published by the WEF and WTO: 'Traceability can also help to monitor the lifecycle of a product with a view to reducing fraud and theft or to assessing its contribution to a global circular economy.'

'Trade agreements could encourage the development of a global certification framework whereby accredited digital identity operators would issue globally recognised digital identities.'

Treating people the same as 'any package, pallet, or container' means not just tracking the movement of you and me, but measuring how we are performing, how we are being used, and so on.

Four years later and everything is progressing exactly as planned – digital ID for people and products.

After that comes the digital twinning of everything in nature.

As the WEF Global Risks Report 2019 states: 'Authoritarianism is easier in a world of total visibility and traceability.'

# Learn the language of lies

## Gaze on Gaza reveals flipped facts and forgotten foul play

by **SERENA WYLDE**

**PROPAGANDA** seeks to drive a quiet acceptance of a falsehood through familiarisation – for example, a simple slogan continually repeated over the airways, and in turn by the public.

In short, it is a mechanism to embed a lie in the public consciousness and deflect accountability. The propaganda's message may lie dormant among those who have long embraced it, but dismantling it with clarity acquires a power of its own.

Crimes have perpetrators. And if we are to have peace and reconciliation, we must acknowledge past crimes and have accountability for the present ones.

This moves us on to Dr. Rahmeh Aladwan, a Palestinian NHS doctor who was suspended by the General Medical Council for her forthright posts, deemed to be 'antisemitic'.

In an interview with brand strategy consultants Propaganda & Co., Dr. Aladwan was asked why she attaches so much importance to language when Israel's power comes from the material forces of money, weapons, leverage and influence over politicians and the media.

Her response was that Israel's material power was sustained and justified by language.

She gave examples of this language, including the slogan 'Israel has the right to defend itself' while its government obliterates and levels Gaza.

And the accusation of 'antisemitism' deflects attention away from what many describe as a genocide being carried out by Israel.

She highlights the claim 'Israel is the only democracy in the Middle East' that is used to justify a supremacist entity built on stolen land.

The term 'Jewish safety' is used while Muslims and Christians are being dispossessed and mass-murdered.

She claims that once you move beyond the Zionist framing and, instead, start to name the real problem, you become a threat, which is why citizens are being arrested in the UK – and across the world – for what they say.

Doctors are suspended from their posts, journalists are sacked for challenging Israeli spokespeople on air. All while journalists, doctors and aid workers are shot in Gaza to prevent them from bearing witness to Israel's atrocities.

Dr. Rahmeh Aladwan. Photo: Doctor Rahmeh

**Why should a people being erased also have to edit their own testimony into a tone acceptable to those who looked away?**

In April of this year, the Foreign Office cut funding for the unit tasked with documenting Israeli war crimes in Palestine and Lebanon. The decision cut off the Foreign Office's access to an open-source database containing approximately 26,000 verified violent incidents dating back to October 7, 2023.

Each year, on March 30, Palestinians mark Yom Al-Ard, Land Day, which marks the day when Israeli forces killed six unarmed Palestinian citizens and injured over 100 others during protests in 1976.

This year, 23 year-old Gazan poet and journalist Nour El Assy wrote a piece explaining both the importance of Land Day and of language. Of Land Day, she wrote that it was not a nostalgic ritual of heritage. It was 'a political wound'. She called it 'an annual acknowledgement of the scene of the crime, of a truth that much of the world still tries to ignore, soften, or bury.'

She wrote that, while growing up, she began to understand that foreign reporters reduced and summarised military escalation or the latest round of bloodshed

'as if history had begun that morning'.

The Palestinian struggle has always been about their right to exist on their own land, and the violence mobilised against them for their refusal to vanish.

El Assy explains: 'That is why language matters so much when it comes to Palestine, and why I am no longer interested in the false dignity of neutral phrasing. Too much respectable writing still treats the [1948] Nakba as though it were a sad migration, an unfortunate side-effect of war, a regrettable demographic rearrangement produced by chaos.'

'Palestinians are said to have been "displaced". Villages were "abandoned". Populations "led". This is the grammar of language laundering. Villages do not abandon themselves. People do not become refugees because a sentence in the passive voice carried them across the border. Zionist militias attacked Palestinian towns and villages in 1948. They expelled civilians. They terrorised communities. They killed Palestinians and drove more than 700,000 from their homes.'

'As a student, I read the archives and saw how empire drafted us out of political existence. As a journalist, I have documented what this policy does to flesh – the maimed child, the mother searching rubble, the father learning to count the dead by the absence of voices at dinner.'

'As a writer, I know language can either expose power or conceal it. As a citizen, I know that pretending not to see is one of the oldest forms of complicity.'

'As a human being, I know there is something morally rotten in a world that still asks Palestinians to make our suffering more palatable before it can be believed. Why should a people being erased also have to edit their own testimony into a tone acceptable to those who looked away?'

'For decades, Israel was framed by the West as fragile, embattled, civilised, and perpetually reactive. Palestinians were framed as excessive, dangerous, emotional, and backward. When we were not demonised, we were sentimentalised as victims, mournable only when silent.'

'The result was a moral economy in which the coloniser's fear was legible, and the colonised person's memory and lived experience were suspect. We were asked to moderate our vocabulary. If not, we were simply labelled antisemitic, creating and perpetuating the falsehood that anti-Zionist and antisemitic are the same thing. Meanwhile, the violence against us remained immoderate in every conceivable way.'

'Israel did not inherit an empty land and then find itself tragically trapped in conflict. Zionist militias, and later, the Israeli state built power through dispossession of Palestinians. Britain helped authorise the premise. Western institutions helped sanitise its language.'

'Today, after all the massacres, all the burials, all the erasures, all the lies, the world is once again being invited to move on because a [so-called] ceasefire has created the appearance of an ending.'

'But Land Day exists precisely to prevent that kind of amnesia. It tells us that what is being fought over is not only territory, but memory, legitimacy, heritage, culture, and the right to say that we were here, we are here, and this is being done to us.'

# Have you beaten our record?

## Enlightenment hits England's provinces: Great awakenings afoot

by RICHARD HOUSE

**HERE** in Gloucestershire, our Stroud-based freedom group has been handing out *The Light* paper every weekend for over six years.

Last late-September weekend, we managed to hand out over 1,000 papers to people willingly taking a copy – beating our previous record hand-out by a considerable distance.

It's extraordinary what a small, committed group of determined freedom activists can achieve. Our group hasn't missed a single weekend in handing out *The Light* paper since autumn 2020.

It took just eight of us to give out 1,050 papers in Stroud, Swindon and Gloucester last weekend. Just imagine a crowd of a thousand people scrolling through our beloved paper, many reading it for the first time.

*The Light* pouring through in Gloucestershire

In Swindon town centre last Saturday, the intrepid Debbie Hicks joined us, with Debbie conducting a 'vox pop' on the issue of conscription, with her trusty blackboard and chalk. All bar one of the many people

she spoke with were strongly against conscription – very heartening.

A key 'external' variable in achieving hand-out success is footfall. Within 30 miles of Stroud, we are fortunate to have several large population centres – Gloucester, Cheltenham, Cirencester and, a bit further afield, Swindon. Our group buys well over 2,000, sometimes 3,000 papers each month, out of our own pockets, and we share a common delight in doing something proactive and effective in raising people's awareness.

What an antidote this is to the demoralisation and helplessness that it's so easy to experience in the face of the globalist putsch. And imagine just how good it feels when someone eagerly approaches us, exclaiming how much they LOVE this paper. Someone recently said to me that if it hadn't been for *The Light* during covid helping to preserve her sanity,

she wouldn't be here now.

What a service it is to humankind to disseminate this unique, freedom-loving organ of truth-seeking and humanity, in the face of a lockstep legacy media that treats the consumers of its propaganda products with utter contempt.

It's impossible to over-state just how empowering it is to get this wonderful newspaper into the hands of so many people; and little if anything can give a deeper sense of satisfaction at the end of a long weekend than does the countless engaging conversations we have with ordinary people who are desperate for freedom and truth.

Nothing would please us more, finally, than to hear about another freedom group surpassing our own record. If we coalesce together and build a critical mass in taking our message onto the streets, absolutely nothing can stop us.

# True Pearls: Ursula Le Guin, 1929-2018

by RICHARD HOUSE

## American novelist, anarchist, poet, woman of letters

**Don't shove me into your damn pigeonhole where I don't fit, because I'm all over. My tentacles are coming out of the pigeonhole in all directions.**

To hear, one must be silent.

**If you evade suffering you also evade the chance of joy.**

Absolute freedom is absolute responsibility.

**We will not be free if we do not imagine freedom. We cannot demand that anyone try to attain justice and freedom who has not had a chance to imagine them as attainable.**

Freedom is not a gift given, but a choice made, and the choice may be a hard one. The road goes upward towards the light.

**Anarchism's principal target is the authoritarian state (capitalist or socialist); its principle moral-practical theme is cooperation (solidarity, mutual**

Ursula Le Guin, author of the *Earthsea Trilogy*

**aid). It is the most idealistic, and to me the most interesting, of all political theories.**

What is an anarchist? One who, choosing, accepts the responsibility of choice.

**Any human power can be resisted and changed by human beings.**

The creative adult is the child who has survived.

**Change is freedom, change is life. It's always easier not to think for oneself. Find a nice safe hierarchy and settle in. Don't make changes, don't risk disapproval, don't upset your syndics.**

**It's always easiest to let yourself be governed.**

Writers know words are their way towards truth and freedom, and so they use them with care, with thought, with fear, with delight. By using words well, they strengthen their souls. A writer's first duty is to use language well.

**We read books to find out who we are. All a book needs is light, a human eye, and a human mind. It is not one of a kind, and it is not ephemeral. It lasts. It is reliable. By and large, books are mankind's best invention.**

A dangerous book will always be in danger from those it threatens with the demand that they question their assumptions. They'd rather hang on to the assumptions and ban the book.

**Resistance and change often begin in art, and very often in our art – the art of words.**

All of us have to learn how to invent our lives, make them up, imagine them. If we don't, our lives get made up for us by other people. It is above all by the imagination that we achieve perception, and compassion, and hope.

**What sane person could live in this world and not be crazy?**

The worst walls are never the ones you

find in your way. The worst walls are the ones you put there.

**All knowledge is part of the whole knowledge. Once you have seen the larger pattern, you cannot go back to seeing the part as the whole.**

There have been no societies that did not tell stories.

**Injustice makes the rules, and courage breaks them.**

The only questions that really matter are the ones you ask yourself.

**You cannot buy the revolution. You cannot make the revolution. You can only be the revolution. It is in your spirit, or it is nowhere.**

There are no right answers to wrong questions.

**The important thing is not the finding, it is the seeking,**

Hard times are coming when we will be wanting the voices of writers who can see alternatives to how we live now, and can see through our fear-stricken society and its obsessive technologies to other ways of being, and even imagine some real grounds for hope. We will need writers who can remember freedom. Poets, visionaries – the realists of a larger reality.

Autumn edition

## The Dieppe raid exposed

by John Hamer

### *Sea stained red in amphibious assault disaster*

Like Dunkirk, the Dieppe Raid on August 19, 1942, known as Operation Jubilee, was a military disaster promoted by the propaganda-masters as a victory.

In total, there were 6,000 troops involved, including 5,000 Canadians – the rest consisting of British Commandos, a few Frenchmen, and a token force from the U.S. Ranger battalion. In fact, their raid on Dieppe was a bloody massacre and humiliation for the allied forces.

The operation was spearheaded by Winston Churchill's new Chief of Combined Operations, the incompetent paedophile, Lord Louis Mountbatten, who chose the Canadian 2nd Division to lead the attack.

The objective was to seize and hold a major French Channel-port, test new amphibious equipment, gather intelligence from prisoners and to gauge the Germans' reaction to a sea-based invading force.

Churchill also hoped the use of Canadian troops would satisfy the Canadian commanders following the long inactivity of Canadian forces in England.

General Andrew McNaughton, who commanded the First Canadian Army and General H.D.G. Crerar, commander of the Canadian troops, both conscienceless warmongers, eagerly embraced this chance for Canadian soldiers to get some combat experience.

They had been stationed in England

Destroyed landing craft, Churchill tanks and dead Canadian soldiers on Dieppe beach 1942. Photo: pd

for two years without having ever engaged the enemy in a major operation. Canadian public opinion, no doubt stoked by the controlled government and media, was starting to question this inactivity.

Churchill also needed some good news to counter the defeats in Africa earlier in the year. The British press were also clamouring for further action, the Soviets were pushing U.S. President Franklin D. Roosevelt to open a second front in Europe, and the overconfident Americans, in turn, were pressurising Churchill to mount some kind of high-profile operation.

The British Prime Minister was reluctant to agree to a full-scale assault with a poor chance of success but he nevertheless sanctioned Mountbatten's sheer folly.

So on the evening of August 18, almost 240 ships left British ports but, as they approached the French coast the next morning, things began to go wrong.

The ships carrying No.3 Commando ran into a German convoy which alerted coastal defences at Berneval and Puits, thus meaning that there would be even less chance of success.

The vessels carrying No. 3 Commando were scattered and most of the unit never reached shore,

with those that actually did being quickly overwhelmed.

One small party of twenty commandos got within 180 metres of the German shore battery and their accurate sniping prevented the guns from firing on the assault ships for two-and-a-half vital hours, before they were safely evacuated.

At 05am, 2km east of Dieppe, the Royal Regiment of Canada made its approach to the narrow beach at Puits, a small seaside village. They were behind schedule and had lost the advantages of surprise and darkness and, as the sun rose, the well-entrenched German defenders opened fire on the landing craft that were still ten metres from the beaches.

At 5.07am, the first craft lowered its ramp and exiting Canadian soldiers were met with an intense storm of machine-gun and mortar fire, and fell in great numbers, mowed down by bullets and shrapnel. Indeed, those few who made it to the heavily barbed-wired seawall were taken prisoner after a short, but ultimately useless resistance.

A total of 200 were killed and 20 died later of their wounds – only 33 made it back to England and the rest were taken prisoner. It was the heaviest toll suffered by a Canadian battalion in a

single day throughout the entire war.

The failure to clear the eastern headland enabled the Germans to liberally strafe the Dieppe beaches which condemned the main frontal attack to abject failure from the start.

The main attack took place at 5.30am, 30 minutes after the flanking assaults, the tanks being deployed in the centre with the Essex Scots to the east and the Royal Hamilton Light Infantry to the west.

Then at around 7am, the disaster was compounded as the Canadian reserve troops – 600 men of Les Fusiliers Mont-Royal – were deployed to the beach due to a mistaken signal that the advance troops had gained a foothold in the town.

The Canadians came under intense bombardment and machine-gun fire and only 125 men made it back to England. On White Beach, 369 men of No.40 Commando, Royal Marines landed under intense fire, and none of those few who actually got ashore, achieved more than a matter of yards.

At 10.50am a general order to retreat was issued and, as the tide rose, the sea was stained with red, and many helpless wounded were also carried away by the waves with the dead.

Despite all of this, Mountbatten,

informed the War Cabinet that the raid had gone 'very satisfactorily'.

It certainly was not for those unfortunates who lost their lives in this utterly unnecessary folly.

In fact, 907 Allied troops were killed, 2,460 were wounded and 1,874 were taken prisoner.

Of the 2,210 who did make it back to England, only 36 were unhurt despite the fact that 200 had not even made it to the French shore.

During the raid, Allied air power suffered its biggest single-day loss of the war, with 106 aircraft destroyed. Without a single exception, every tank crew member was a casualty and, overall, 60 per cent of the invading force became casualties whereas the plan had estimated just ten per cent.

In his report, the deluded warmonger Mountbatten wrote that the 'planning was excellent, air support faultless and naval losses extremely light.' He added that 'of the 6,000 men involved, two-thirds had returned to Britain.'

German losses were 500 dead and there were very few prisoners of war taken. That so few were taken prisoner may have had something to do with the Allied propensity for casually shooting prisoners. A Canadian observer had personally witnessed one such incident when Canadian troops shot eight German prisoners-of-war.

The Germans claimed that, during the raid on Dieppe, the local population assisted them in fighting off the attacking Allied troops – bringing them water, food, and in some cases, ammunition.

Adolf Hitler soon after approved the repatriation of French POWs to the region.

# Letters to TheLIGHT

Love us or hate us, we are helping raise the level of debate in this country and across the world, so we welcome views from all perspectives, because the enemies of free thought and free speech are censorship and group-think. We are all individuals – let's have your thoughts! *Please email: [letters@thelightpaper.co.uk](mailto:letters@thelightpaper.co.uk)*

## Dear The Light,

The huge downside to becoming 'awake' is having to come to terms with the incredibly sad fact that the world would be such a happier place if the massive false flags and crimes against humanity had not been allowed to happen. How much safer and content would the world feel if 9/11, Covid, JFK and various manufactured wars had not happened. Sometimes it is hard to see The Light.

*Josh Hyson*

## Dear The Light,

**While the eloquent Reform and Restore figureheads placate the masses with future optimism, we all should consider how erudite they really are.**

Why? Because the balkanisation and rudimentary divide and conquer principle continues right on target for the end of the decade.

Furthermore, In my humble opinion, mankind isn't as clever as he thinks he is. For example, spraying the skies with pollution is a potentially catastrophic experiment, and we can only theorise what the ultimate results will be. Also, trying to create machines that will replace us is self-defeating. People who finance these ideas do so simply to increase the amount of money they have. Money they ultimately will never be able to spend.

*Peter Manley*

## Dear The Light,

**I am writing briefly to point out a factual error in my book review of Tim Bragg's novel 'The Experience' [Light Paper 72, p.11].**

In the review, I introduced my own term 'trajectory realism' as a counterfoil to the disingenuous conspiracy theory or 'conspiracy theorist', but in the published review it currently reads 'He

## Dear The Light,

**I recently read Sarah Dawkins' letter about the body's extraordinary capacity to heal, and it resonated deeply with me because it describes a journey I have been on for many years.**

I trained as a chiropractor and spent years in practice. Like most practitioners, I began with the belief that if I became technically better at what I did, I would get better results.

But something increasingly troubled me, despite being one of the most qualified chiropractors in Britain, my results were inconsistent and average.

Sometimes people experienced remarkable changes. Other times, despite apparently doing everything correctly, very little happened. I became increasingly dissatisfied with simply accepting that this was the nature of healthcare.

Eventually, I stopped practising chiropractic altogether.

But I never stopped asking the question: why does one person heal when another doesn't?

That question ultimately changed everything.

Rather than studying another technique, I began looking at healing itself. What were the common principles present when people experienced profound

Relax! Your body knows what to do. Photo: pd

changes, irrespective of the particular therapy being used?

I gradually came to believe that the technique or modality is not the most important part of the equation. Chiropractic, osteopathy, acupuncture, massage and numerous other approaches can all be extraordinarily effective in the right circumstances.

The important question is: what allows the individual to heal?

I began applying what I was learning, and the difference in the results we were seeing was extraordinary.

That eventually led to the creation of The Health Advantage in Cornwall, where our focus is not simply on treating a diagnosis or repeatedly managing symptoms, but on understanding what may be preventing an individual's

own healing processes from functioning effectively.

Today, we have accumulated more than 200 patient reviews and testimonials. What interests me most isn't the number, but the stories behind them.

We regularly see people with chronic and longstanding problems who tell us they have already tried numerous practitioners, treatments and approaches. Some report having spent thousands of pounds searching for answers.

And yet we have seen some of those same people report remarkable changes.

These aren't claims that everybody will respond, nor do I believe any practitioner should promise that. They are the experiences reported by our patients, and I believe they

raise a question that healthcare desperately needs to investigate: what is happening when somebody who has struggled for years suddenly begins to get better?

Instead of dismissing those cases because they don't fit an accepted model, shouldn't we be intensely curious about them?

Practitioners don't heal people. At best, we create circumstances in which the extraordinary intelligence already present within the human body can do what it is designed to do.

I believe we have spent far too much time arguing about which healthcare profession, technique or philosophy is right, and nowhere near enough time studying the people who actually get well.

*Dr Jonathan Gleed*

offers instead the term 'trajectory realism', explicitly implying that the term originates with Tim Bragg. It should read 'I offer instead the term trajectory realism', as it originates with me. Please refer to the above review for the explanation of the term and the context. Please can you publish this correction e.g. in the Letters page for the next issue, and, if possible, correct it online?

*Wayne Sturgeon*

## Dear The Light,

The fans were so excited

The game was on their screen

But who is really winning

What does it even mean?

The fans say "we" are winning

When a shot it didn't miss

But all they really did that day

Was drink beer and take a piss

Distracted by the circus

Brains washed by media hype

I hope that they wake up someday

And maybe see the light

For there really is no substance

In men chasing a ball

So ditch the bread and circus

And heed humanity's call

*David Kane*

## Dear The Light,

**In the course of a 30-year career teaching teenagers with special needs and/or behavioural problems, I occasionally came**

**across children who would put their fingers in their ears and, in an attempt to demean others, repeat the word – Boring! Boring! Boring!**

I was reminded of this as the word BORING! flashed across the Reform's Party Conference screen as Farage laughed and a woman was assaulted in front of him.

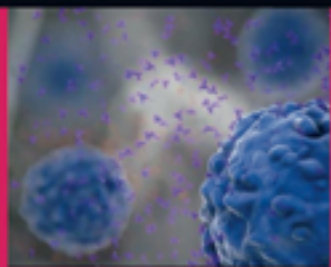

Personally I found the episode deeply disturbing rather than boring.

*Anthony Hentschel*

*"When we drink Grander Water, it is as if we are refreshing ourselves from a pure mountain spring"*

#### Water & Family Health

Water loses its natural energetic potential when treated with chemicals and pumped through pipes over long distances, causing water to become damaged, stagnant less vital and flat to the taste, losing its natural health giving properties.

- Choose to have a vibrant healthy water flowing from every tap in your home
- The taste and quality of bottled water straight from your tap
- Scientifically proven to reduce scale, increase microbiological stability and save on heating costs

Table top systems from £225 & £1,161 for single tap systems to standard house systems with up to three baths prices from £3,980
